“2112” - Dual Combo

Introducing the **“2112” Dual Combo** that combines two iconic circuits to capture the legendary sound of RUSH's early years. This Combo features the "Phaser" and "Plexamp" circuits, designed to work in perfect harmony to recreate the early tones of Alex Lifeson in RUSH.

The "Phaser" combines elements from several iconic designs, it achieves smooth transitions between phase shifts, enhancing modulation for an organic tone. The Phaser offers precise control over Rate, Intensity, Volume, and Voice, allowing you to fine-tune your sound like never before. Enjoy reduced noise levels for a cleaner audio experience.

The "Plexamp" circuit serves as a quality Marshall amplifier tone with excellent tone shaping controls. Going a step further, this circuit when used in tandem easily replicates many 70s sounds then reverse the order for an entirely different set of useful tones.

Key Feature:

- Built-in order switching for endless tonal possibilities, to easily reverse the signal path. Use a “Stubby” or short bat switch.

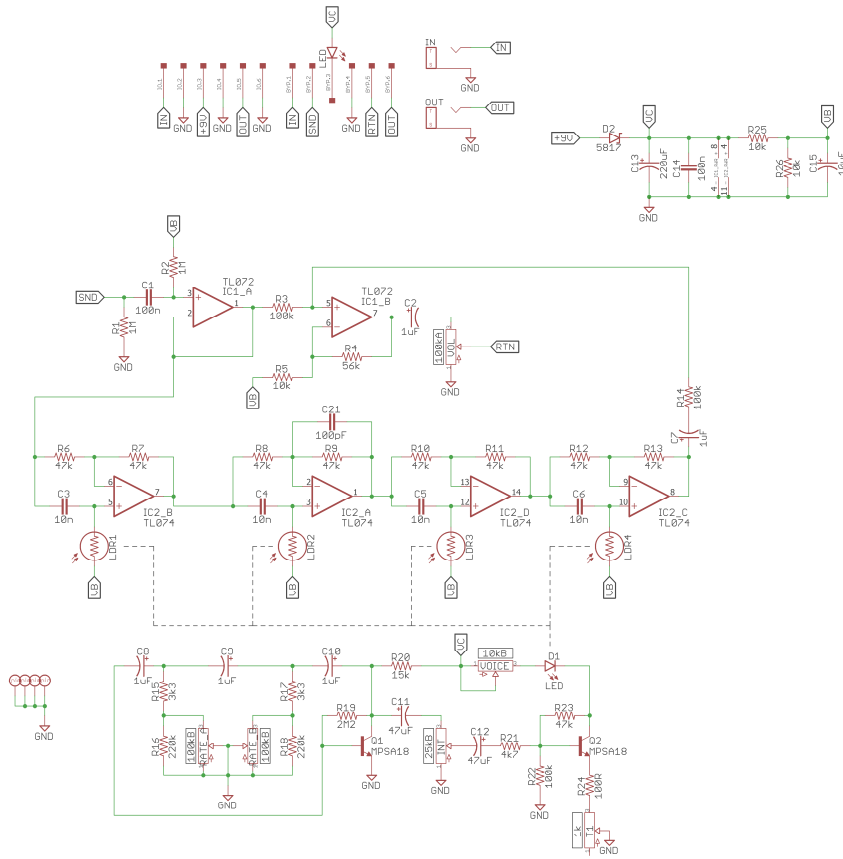

Order switching is built-in, with pin header connections making wiring a breeze.

Ideal for a 1590BB2 enclosure, featuring the same dimensions as a 1590BB but with 125B clearance for jacks.

Included with each Dual Combo purchase. – (2) Mainboards, (2) pin headers, (1) Dual wiring board.

R8	470k	C7	47n			LED	Status
		C8	100uF	IC1	4558	* CLR x1	1k8-4k7

* You'll need a 3PDT toggle switch On/On (solder lug version) with a short shaft (stubby) for order switching on the dual wiring board PCB.

Build Notes:

1. Solder the short side of both pin headers to the top of each main board, pointing upward. Next, solder all three switches, and (CLRs), to the dual wiring board. Dry hang the LEDs (optional) if mounting to the dual wiring board.
2. Since the dual wiring board offers an additional LED location for each circuit, you can choose your preferred setup. Whichever option you pick, solder a small jumper on the unused LED pads. (CLRs) are essential regardless of the location choice.
3. If you order the Tayda drilled enclosure with my link (see shop page) you must install the Status LEDs on the wiring board.
4. Remove both nuts on each of the 3PDT foot switches for the best height match. Adjust the height of the inner Order Switch adjustment nut so it is level with the foot switches' height relative to the enclosure. Do not over-tighten the outer Switch nut.
5. Install the wiring board by sliding it over both pin headers. Once the foot switches and toggle switch are tightened within the enclosure, proceed to solder the long side of the pin header to the dual wiring board.
6. * There are two (CLR) Current Limiting Resistors crucial to protect and adjust the brightness of their corresponding status LED. You may use a value of 1k8 (Bright) to 4k7 (Dim).
